FOUNDRY & MACHINE WORKS

ALTEN'S FOUNDRY & MACHINE WORKS, LANCASTER, OHIO

ALTEN PUMPING UNITS

ADVANTAGES

Field transportation and installation held to a minimum due to self-contained, unit type skid base which gives maximum strength with minimum weight and also eliminates necessity of an expensive foundation.

Housing necessity minimized, entire unit of weatherproof construction.

High mechanical efficiency due to helical gearing and Timken equipped double reduction reducer. Shafer self-aligning roller bearings used both on wrist pin and equalizer. Straight polished rod lift obtained through arc type hanger. Hanger may be tipped back for well servicing.

Effective balancing is obtained through the Master and Auxiliary Crank Weights in connection with the sectional beam weights.

Stroke lengths and pumping speeds adjustable to maximum efficiency.

Unit constructed for use with any type multi-cylinder engine or electric motor.

All bearings and working parts easily accessible for inspection and lubrication.

Reliable brake for stopping and holding load in any position.

CONSTRUCTION

Samson Post and Frame Assembly

Unit is fabricated from heavy structural steel sections, rigidly electric welded into one integral structure.

Saddle and Bearings

The Saddle is fabricated of heavy steel shafting and plate rigidly welded. Bearing housings are machined heavy semi-steel castings equipped with high quality anti-friction bronze-bushings. These housings are spherical for axial bearing alignment. Bearings are provided with Zerk fittings and seals to retain the grease.

Walking Beam and Beam Hanger Assembly

The walking beam is a C.B. section reinforced with webbed stiffeners. The arc type hanger assures straight lift for moderate speeds. Head may be folded back for well servicing. The polished rod clamp is of the heavy duty type with extra flexible wire rope attached by splentering.

Reduction Unit

The unit incorporated in this design is of the double reduction type. The primary and intermediate pinions are made of Chrome-Nickel steel forged integral with shaft, case hardened and ground. The driven gears are made of medium carbon steel castings, heat treated to the proper hardness. All gears are set up in a lapping machine and run to the proper center distances, thereby insuring good tooth contact. The crank shaft is made from a Chrome-Molybdenum steel forging. All shafts are mounted in high capacity Timken Tapered Roller Bearings.

Crank — Pitman — Equalizer Assembly

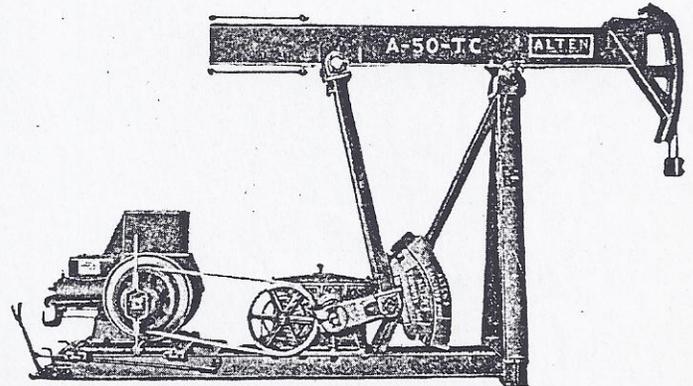

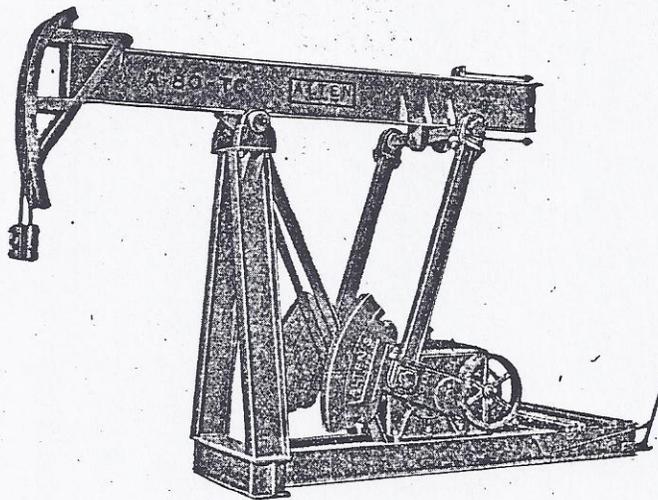

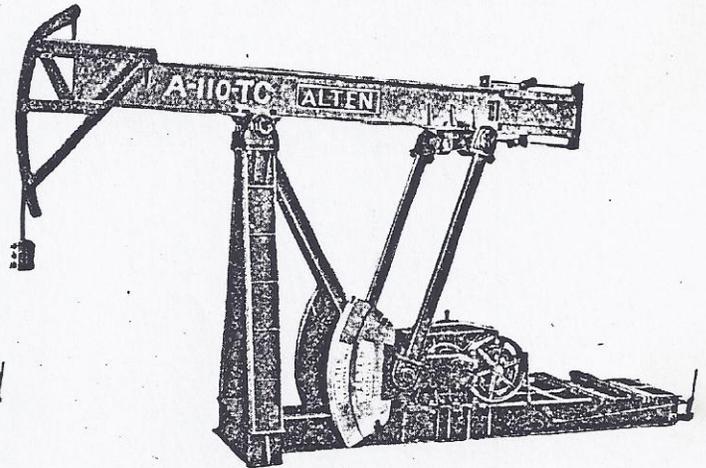

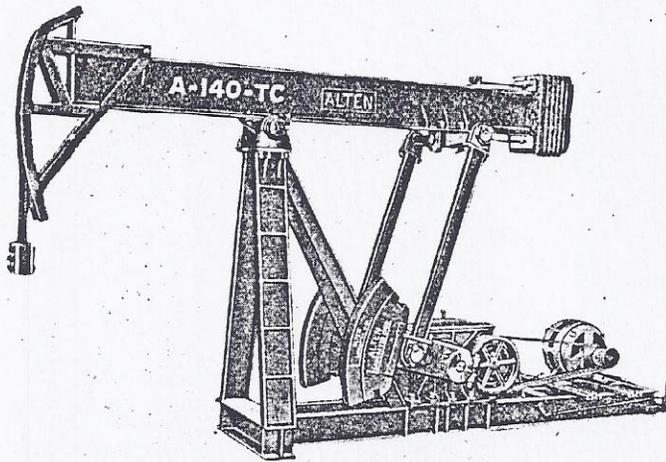

The design of this unit is such that any minor misalignments are readily and satisfactorily corrected.

The wrist pin and upper pitman bearings are of identical design. Double row Shafer spherical roller bearings were selected for long trouble-free life. These bearings are flood or Zerk lubricated and protected by Victor oil seals. Pitman Shafts are heavy I beam sections with a steel plate welded to either end of beam. Semi-steel bearing housings are assembled to Pitman beams with U bolts, thereby permitting changing of wrist pins in holes without removing the entire Pitman assembly.

The equalizer beam is a heavy steel forging mounted in plain pillow blocks bolted to the walking beam.

The cranks are heavy semi-steel castings. Master and auxiliary weights may be bolted to these cranks.

ALTEN'S FOUNDRY & MACHINE WORKS, LANCASTER, OHIO

ALTEN PUMPING UNITS

General Specifications

DESCRIPTION	A-140-TC	A-110-TC	A-80-TC	A-50-TC

Total Weight of Unit with Crank Weights, Engine Slide Rails, less Beam Weights and Engine, pounds.....	8,250	6,560	3,530	2,300

ALTEN'S FOUNDRY & MACHINE WORKS, LANCASTER, OHIO

SELECTION AND CARE OF ALTEN PUMPING UNITS

It is highly important in selecting the correct pumping unit for each installation that the following data be considered:

1. Depth of well.
2. Size of plunger.
3. Sucker rod size.
4. Estimated daily production in bbls. (oil and water).
5. Hours of operation per 24-hour day.
6. Fluid level.
7. Gravity of fluid.
8. Tubing size.
9. Gas pressure.

With this information we can recommend the exact unit to provide greater pumping efficiency. We maintain service representatives in most producing fields to help you select the proper unit. In addition, the factory maintains an Engineering Department which is always at your service.

The charts in this catalog are also included in our Bulletin P-105, copies of which are available.

Chart VII which covers production may first be used to get a rough idea as to what stroke and pumping speed will do the job. The plunger diameter and production are known. Working from this information you may determine the two factors mentioned above.

It is important that the length of stroke chosen be somewhat longer than indicated by the chart in order to allow for loss due to rod and tubing stretch. It is also important that this stroke correspond to some standard unit pumper stroke. With these fac-

tors in mind the problem may now be carried through the charts in numerical order.

In all cases the known factors with the use of a straight edge will indicate the unknown. Should the solution be in error, make slight changes in the direction desired and again carry the problem through the charts. With a little practice it becomes a simple problem of mechanics to operate these charts.

INSTALLATION

Good installation demands:

1. Massive, solid foundation.
2. Foundation should be level.
3. Unit must be securely bolted to foundation.
4. Well center must be accurately measured.
5. Walking Beam must be centered over well.
6. Unit must be properly balanced.
7. Prime mover must be of proper size.
8. "V" belt drive must be accurately aligned.
9. Adjust belts to manufacturer's recommendation.

SERVICE

With proper selection, installation and care, Alten's Pumping Units will give many years of dependable service. We recommend that users:

1. Inspect and lubricate all unit structure bearings weekly. (Summer No. 3, Winter No. 1 grease as per our lubrication chart furnished to all dealers. Do not use hard cup greases.)
2. Inspect unit reducer oil level weekly.
3. Use only unit reducer oils recommended by the manufacturer of these units. Our dealers have these charts.
4. Check all bolts periodically. Do not allow parts to become loose.

INSTRUCTIONS FOR USING CHARTS ON TWO FOLLOWING PAGES

For an example assume the following conditions:

Depth of Well.....	2500 feet
Plunger Diameter.....	1 3/4"
Sucker Rod Size.....	5/8"
Strokes per Minute.....	20
Length of Stroke.....	34"
Tubing Size.....	2"

Chart I—To find the Static Polish Rod Load:
 Column A—Locate 2500 feet
 Column C—Locate 5/8" Rods and 1 3/4" Plunger
 Draw a line between these points. Where line crosses Column B is the Static Polish Rod Load = 5,550 lbs.

Chart II—To find the Acceleration Factor:
 Column A—Locate 20 s.p.m.
 Column C—Locate 34" Stroke
 Draw a line between these points. Where line crosses Column B is the Acceleration Factor = 1.126

Chart III—To find Polish Rod Load in Pounds:
 Column A—Locate 5,550 lbs. Static Load (from Chart I)
 Column C—Locate 1.126 Acceleration Factor (from Chart II)

A line connecting these two points will cross Column B at 6,230 lbs., the Polish Rod Load.

Chart IV—To find the Torque Rating:
 Draw a line from 6,230 lbs. on Column A to 34" stroke on Column C. This line will cross Column B at 42,000 in. lbs. which will be the Torque Rating of the well.

Chart V—To find Loss of Stroke Due to Rod and Tubing Stretch:
 Draw a line from 1 3/4" Plunger on Column A to

5/8" Rod and 2" Tubing on Column C. This line will cross Column B at 1.74.

The Loss in Stroke Due to Rod and Tubing Stretch =

$$C \times \left(\frac{D}{1000} \right)^2 = 1.74 \times \left(\frac{2500}{1000} \right)^2 = 10.9"$$

This loss is then to be subtracted from the stroke = 34 - 10.9 = 23.1"

Chart VI—To find Over-Travel of Plunger Due to Acceleration:

Draw a line from 2,500-foot depth on Column A to 20 s.p.m. on Column C. This line crosses Column B at .0485.

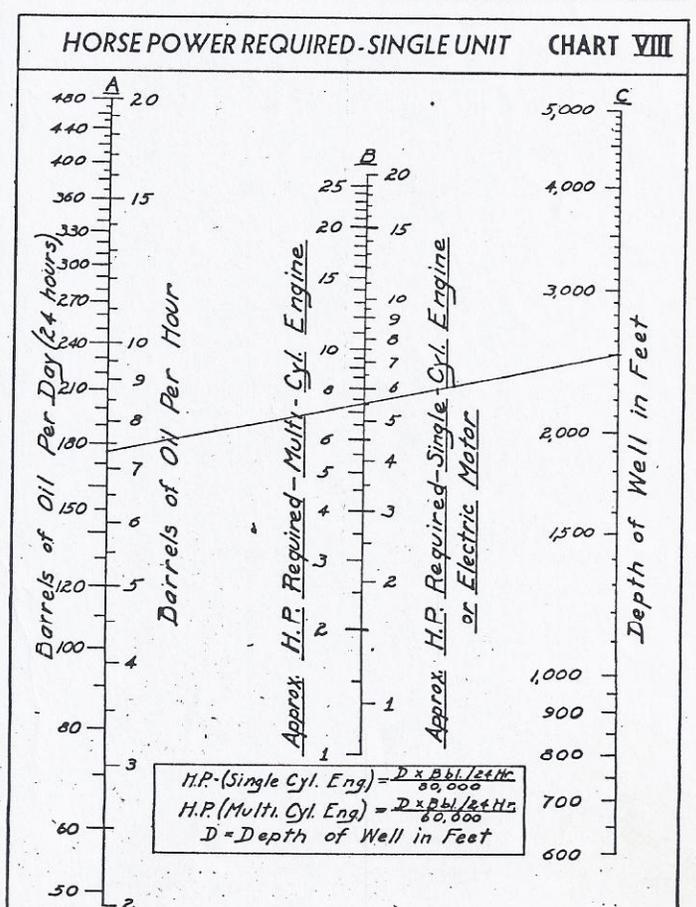

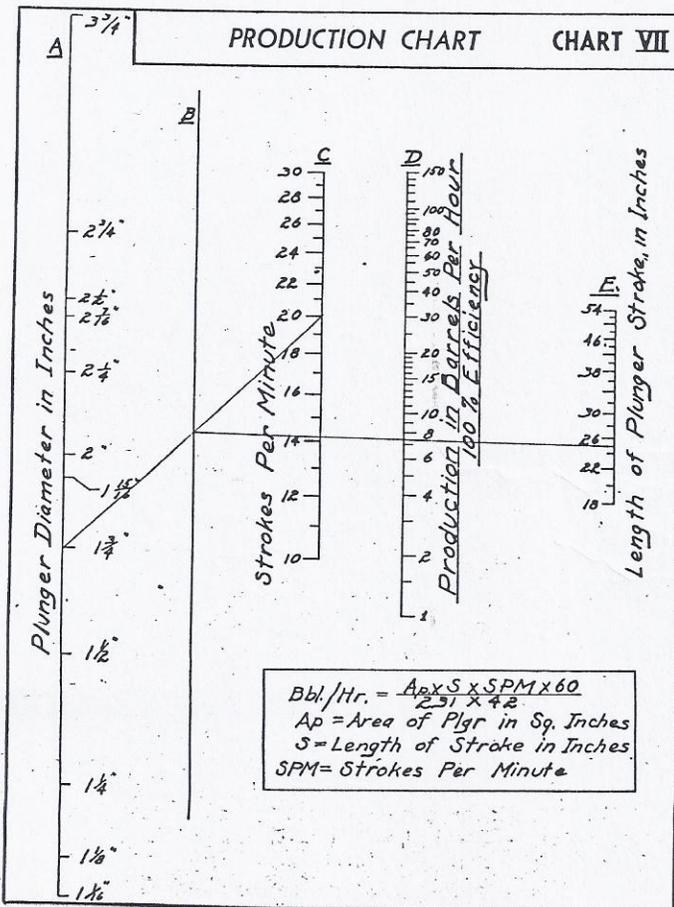

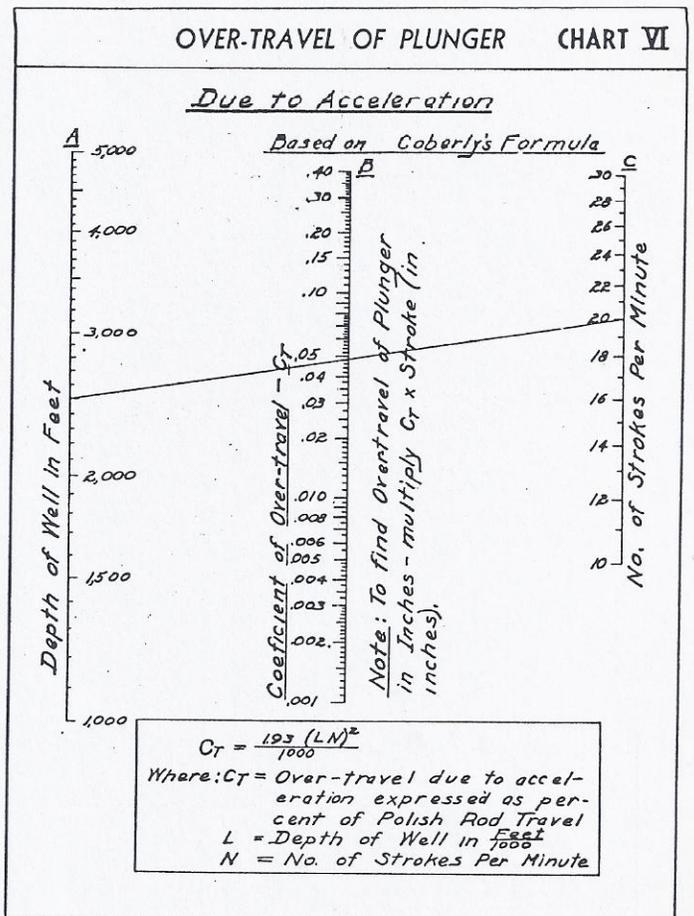

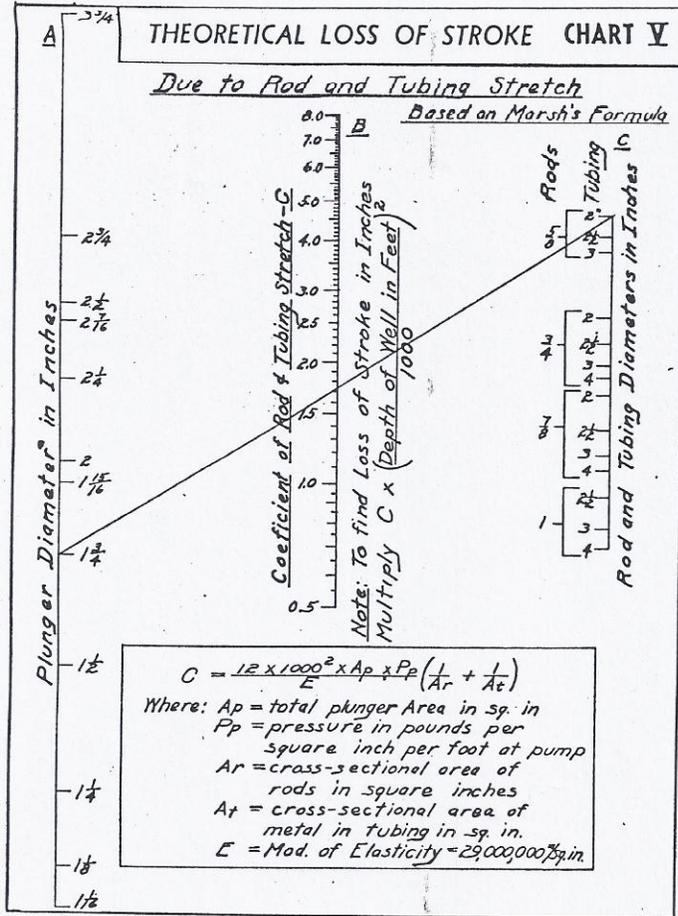

Over-Travel of Plunger = $C_T \times$ Polish Rod Stroke = .0485 \times 34 = 1.65"

This figure is to be added to the Polish Rod Stroke. Theoretical Polish Rod Stroke at the Bottom of the Well = 34 - 10.9 (Chart V) + 1.65" (Chart VI) = 24.75"

Chart VII—To find the Production in Bbl. per Hour draw a line from 1 3/4" Plunger on Column A to 20 s.p.m. on Column C. From the point where this line crosses Column B draw a line to 24.75" stroke on Column E. This line crosses Column D at 7.3 which is the Barrels per Hour Production at 100% efficiency.

Chart VIII—To find the Horse Power Required:
 Draw a line from 7.3 Barrels per Hour on Column A to 2,500-foot Depth on Column C. This line crosses Column B at 7.3 h.p. for Multi-cylinder Engines and 5.6 h.p. for Single Cylinder Engines with heavy fly-wheels.

ALTEN'S FOUNDRY & MACHINE WORKS, LANCASTER, OHIO

ALTEN UNDERPULL PUMPING JACK

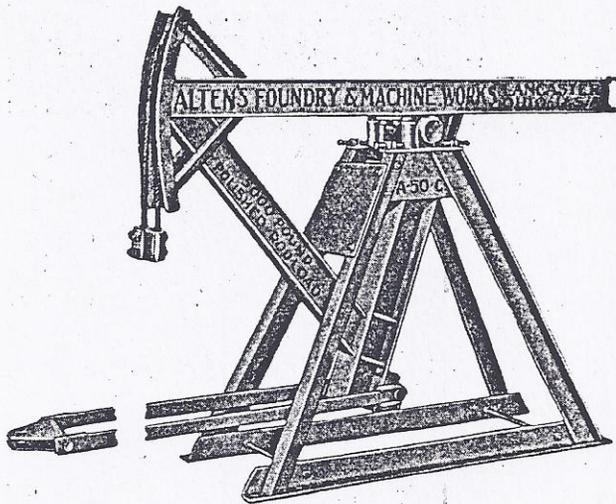

Fig. C-315

These Jacks are heavily designed for long life service and are of the underpull type which reduces the number of pivot points thereby giving better efficiency in counter-balancing. The frame is made in two halves for greater ease in handling but when assembled on foundation gives a rigid assembly. The beam is also assembled in one unit with provisions for bolting on the various parts such as saddle and Pull Bar. The construction permits these jacks to be easily assembled on the foundation and at the same time obtain a perfect alignment over well. The pull rod bars are made of flat steel with equalizing bar for connecting to pull rod lines.

CONSTRUCTION

The entire jack is fabricated from structural steel by electric welding. This method of fabricating gives greater strength and rigidity with no bolted joints to loosen, throwing the jack out of alignment and eventually causing its destruction. The top of frame is constructed so saddle bearings can be moved forward or backward enabling the operator to align the head over center of well. The polish rod grip and hanger is splattered to a 3/4" Extra flexible mild plow steel rope. Machined hole through polished rod grip is provided to insure perfect grip on polished rod.

VARIABLE STROKE

The design of the A-50-C Jacks is made to obtain a variable stroke. Considerable range of strokes are obtained by moving the pull bar bearing box vertically on the vertical member of the beam. An approximate straight line motion of polished rod is obtained through the use of the wire line head.

BEARINGS

Both the Saddle and Pull Bar Bearings are Cast Iron and large oil reservoirs are provided in bearings. Seals are assembled in bearings to retain the oil.

SPECIFICATIONS FOR ALTEN A-50-C UNDERPULL PUMPING JACK

Rated Polished Rod Load.....	5,000 lbs.
Maximum Stroke.....	32 Inches
Maximum Ratio Polished Rod to Pull Rod Stroke....	1.75:1
Minimum Ratio Polished Rod to Pull Rod Stroke....	1.00:1
Center Saddle to Center of Well.....	45 Inches
Overall Length of Beam.....	7 ft. 6 in.
Depth of Beam.....	6 Inches
Size of Beam.....	6" x 6" — 15½ lbs. B.S.
Top of Foundation to Center of Saddle Bearing...	54 Inches
Top of Foundation to Lower End of Hanger at Mid-Stroke.....	35 Inches
Overall Length of Base.....	72 Inches
Overall Width of Base.....	25 Inches
Number and Size of Foundation Bolts.....	8 — ¾" x 14"

Saddle Bearing:

Cast Iron Bearings
Victor Oil Seal Equipped
3" Diameter Trunion
Area of Projected Saddle Bearing.....21 Sq. In.
Oil Reservoir for Heavy Oil

Lower Bearing — Pull Bar Connection:

Cast Iron Bearings
Equipped with Victor Oil Seals
2" Diameter Trunion
Projected Bearing Area.....14 Sq. In.
Oil Reservoir for Heavy Oil

ALTEN ROLLER BEARING "D" STIRRUP BOX

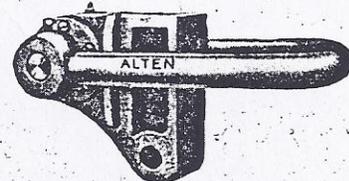

Fig. C-301

This "D" Stirrup Box is interchangeable with other make Jacks. Designed for extremely severe conditions where Common Boxes fail in a short time. Provided with Alemite Fittings so as to give Bearings proper lubrication.

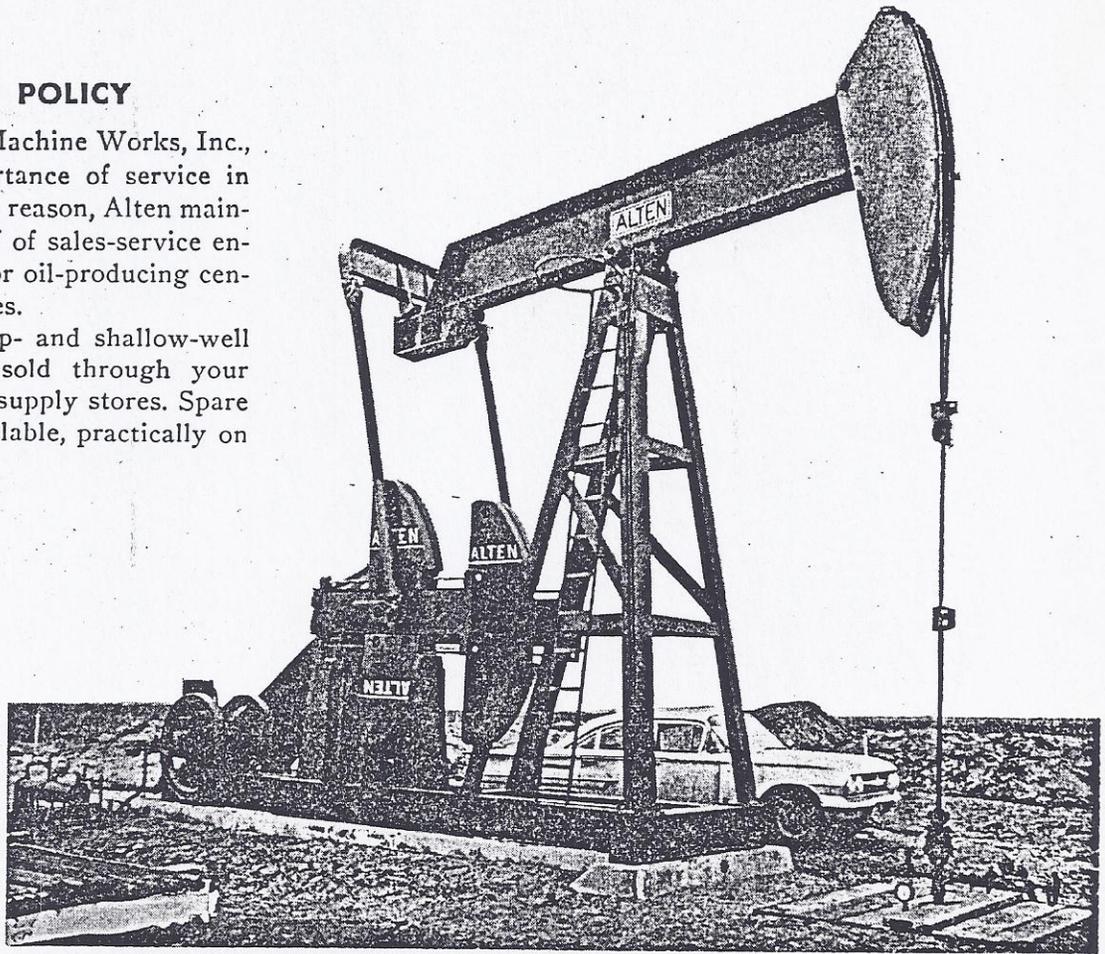

Weight, Pounds..... 58
Price, Each..... \$25.00

A ALTEN FOUNDRY & MACHINE WORKS, INC.

ALTEN'S SERVICE POLICY

Alten Foundry & Machine Works, Inc., recognizes the importance of service in the oil fields. For that reason, Alten maintains a complete staff of sales-service engineers in every major oil-producing center in the United States.

Alten's line of deep- and shallow-well pumping units are sold through your favorite independent supply stores. Spare parts are always available, practically on location.

CONSTRUCTION FEATURES

- **Gear Reducer.** Patented rigid one-piece housing; A.P.I. gears and pinions; Anti-friction bearings throughout; positive lubrication
- **Exclusive Magnetic Oil Cleaner**
Oil in reducer is cleaned of foreign particles by magnetic cleaner and sump; lengthens gear and bearing life
- **Automotive Brake**
Truck-type brake; provides positive safety for personnel
- **Screw-Type Adjustable Counterbalance**
Safest and simplest Counterbalance made; "easiest to use" say pumpers everywhere
- **Bronze Saddle & Equalizer Bearings**
Oversized uncomplicated bronze bearings; four-way adjustment of saddle
- **Step-Down Equalizer**
No bolts in tension; solid rolled steel construction
- **Adjustable Hinged Horsehead**
Swings back for well servicing; adjustable for precise alignment
- **Adjustable Polished Rod Hanger**
Easily adjusted or replaced in field; no babbitted connections
- **Tapered Wrist Pins**
Unique pin-lock design simplifies wrist pin changes; Oversized self-aligning bearings
- **Rugged Frame & Samson Post**
Jig-welded for precision; braced for rigidity; over-engineered for brute strength; all-welded ladder with safety ring standard on larger sizes
- **Easy Installation**
Frames designed for both center-tie-down or foundation-bolt assembly
- **Portable Skid Base**
Rugged, all-welded skid base; permits unit to be changed to or from portable type by just adding or removing the skid base
- **Shorty Type Base (Optional)**
Sturdy motor base; permits the use of shorter foundation

OUTSTANDING FEATURES OF ALTEN SPEED REDUCERS

Precision-machined, heat-treated herringbone gears and pinions are manufactured to A.P.I. specifications. Continuous-tooth herringbone design eliminates side thrusts, provides reserve strength with its arch-like construction, plus very low tooth deflection due to the large number of teeth in contact.

Self-adjusting wipers give positive lubrication to all bearings regardless of direction of rotation.

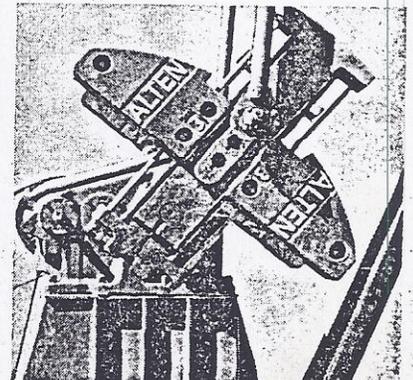

Exclusive magnetic oil cleaner and sump removes foreign matter from the circulating oil, providing clean oil to bearings at all times, thus increasing the life of the reducer.

Sturdy, one-piece housing of high-tensile gray iron, designed for maximum strength and rigidity . . . Rib-reinforced . . . Patented design eliminates condensation problems . . . Assures long life with perfect gear alignment.

Bearings. All shafts are equipped with anti-friction bearings. Heavy-duty roller-type bearings have reserve strength capacity to withstand severe impact loads without damage.

EASIEST AND SAFEST TO COUNTERBALANCE

New type adjustable counterbalance incorporates numerous features not found in any other type. Although rugged enough to meet the most strenuous conditions, it is so amazingly simple that counterbalance weights may be adjusted with wrench we furnish in a matter of minutes by one man standing on the ground. Screw arrangement gives your operator full control at all times and prevents the weights from falling or sliding and positively holds weights in any position at any time. Alten's adjustable counterbalance assures your operator the safest possible working conditions. Calibrations make it easy to locate weights for desired counterbalance. Interchangeable weights of various sizes are offered for all units making necessary only the purchase of such amount of counterbalance essential to each well condition.

STRONGEST IN THE SADDLE

The Alten pumping unit's bronze-bushed saddle bearing is really three sturdy bearings in one. Since only the bottom of the bearing wears, a 120-degree rotation gives you an entirely new bearing surface. You get 200% longer bearing life. And the bronze bearing withstands shock loads best.

- The rugged simplicity of the Alten saddle provides trouble-free operation with an absolute minimum of parts. It is "oversize" to stand up under the heaviest use and worst abuse.
- The Alten saddle also permits easy adjustment of the walking beam to and from the well for centering the polished rod hanger. And it allows convenient lateral adjustment of the walking beam.

MOST PRACTICAL HORSEHEAD

The horsehead of an Alten unit makes servicing your well faster and easier. Remove one bolt and the horsehead swings back over the beam. Or remove the horsehead completely. • Perfect alignment with the well is made possible by means of a radiused support between horsehead and beam. Simple adjusting screws make and maintain alignment. • Full side plates designed for maximum safety of your operator.

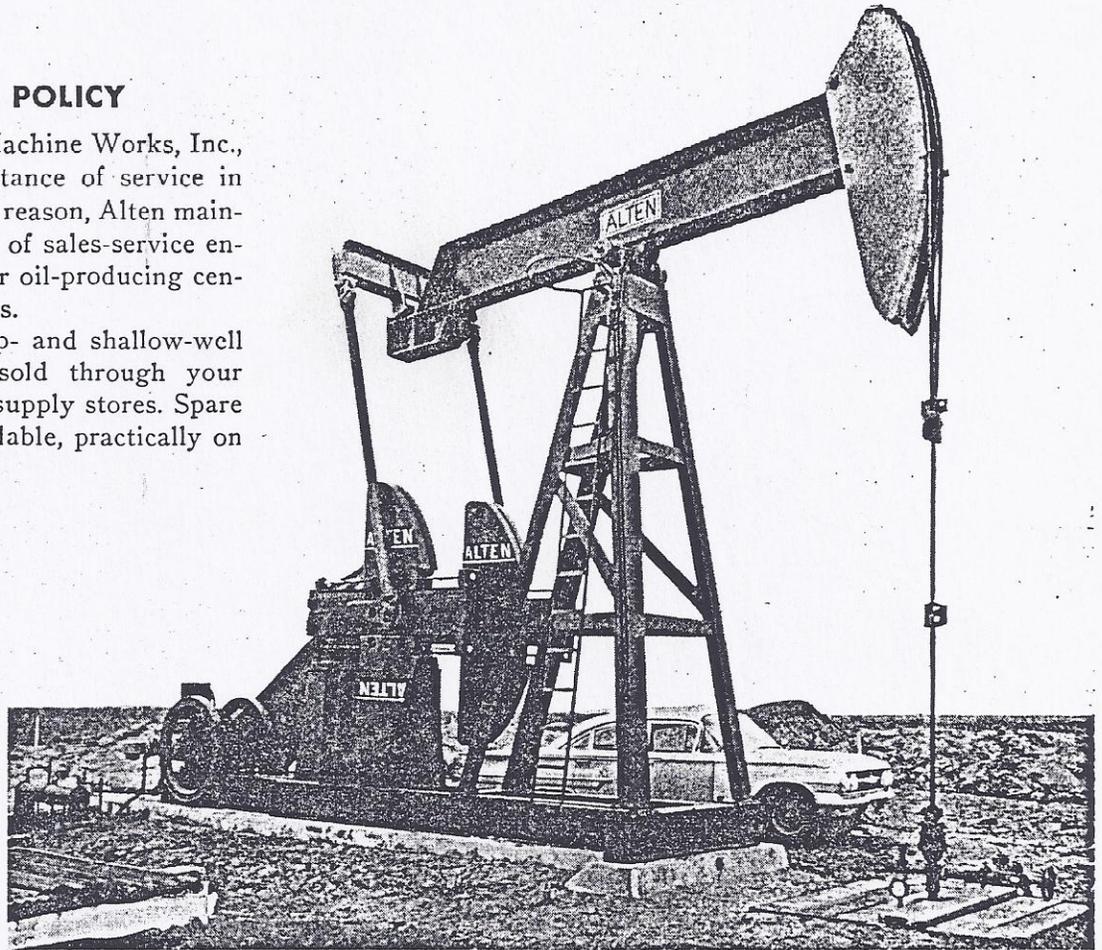

ALTEN FOUNDRY & MACHINE WORKS, INC.

ALTEN'S SERVICE POLICY

Alten Foundry & Machine Works, Inc., recognizes the importance of service in the oil fields. For that reason, Alten maintains a complete staff of sales-service engineers in every major oil-producing center in the United States.

Alten's line of deep- and shallow-well pumping units are sold through your favorite independent supply stores. Spare parts are always available, practically on location.

CONSTRUCTION FEATURES

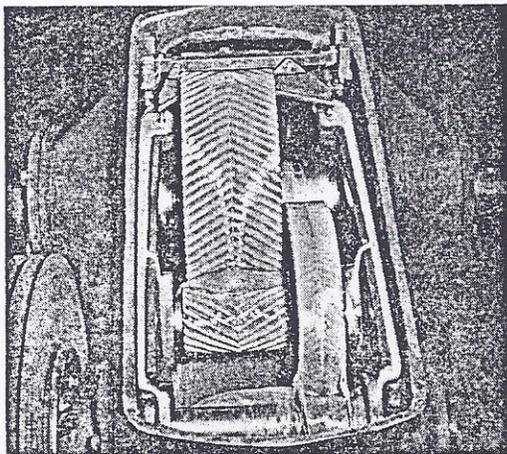

- Gear Reducer. Patented rigid one-piece housing; A.P.I. gears and pinions; Anti-friction bearings throughout; positive lubrication
- Exclusive Magnetic Oil Cleaner
Oil in reducer is cleaned of foreign particles by magnetic cleaner and sump; lengthens gear and bearing life
- Automotive Brake
Truck-type brake; provides positive safety for personnel
- Screw-Type Adjustable Counterbalance
Safest and simplest Counterbalance made; "easiest to use" say pumpers everywhere
- Bronze Saddle & Equalizer Bearings
Oversized uncomplicated bronze bearings; four-way adjustment of saddle
- Step-Down Equalizer
No bolts in tension; solid rolled steel construction
- Adjustable Hinged Horsehead
Swings back for well servicing; adjustable for precise alignment
- Adjustable Polished Rod Hanger
Easily adjusted or replaced in field; no babbitted connections
- Tapered Wrist Pins
Unique pin-lock design simplifies wrist pin changes; Oversized self-aligning bearings
- Rugged Frame & Samson Post
Jig-welded for precision; braced for rigidity; over-engineered for brute strength; all-welded ladder with safety ring standard on larger sizes
- Easy Installation
Frames designed for both center-tie-down or foundation-bolt assembly
- Portable Skid Base
Rugged, all-welded skid base; permits unit to be changed to or from portable type by just adding or removing the skid base
- Shorty Type Base (Optional)
Sturdy motor base; permits the use of shorter foundation

OUTSTANDING FEATURES OF ALTEN SPEED REDUCERS

Precision-machined, heat-treated herringbone gears and pinions are manufactured to A.P.I. specifications. Continuous-tooth herringbone design eliminates side thrusts, provides reserve strength with its arch-like construction, plus very low tooth deflection due to the large number of teeth in contact.

Self-adjusting wipers give positive lubrication to all bearings regardless of direction of rotation.

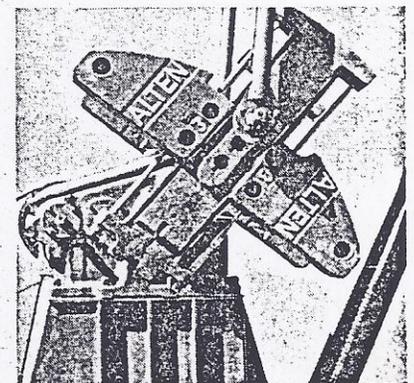

Exclusive magnetic oil cleaner and sump removes foreign matter from the circulating oil, providing clean oil to bearings at all times, thus increasing the life of the reducer.

Sturdy, one-piece housing of high-tensile gray iron, designed for maximum strength and rigidity . . . Rib-reinforced . . . Patented design eliminates condensation problems . . . Assures long life with perfect gear alignment.

Bearings. All shafts are equipped with anti-friction bearings. Heavy-duty roller-type bearings have reserve strength capacity to withstand severe impact loads without damage.

EASIEST AND SAFEST TO COUNTERBALANCE

New type adjustable counterbalance incorporates numerous features not found in any other type. Although rugged enough to meet the most strenuous conditions, it is so amazingly simple that counterbalance weights may be adjusted with wrench we furnish in a matter of minutes by one man standing on the ground. Screw arrangement gives your operator full control at all times and prevents the weights from falling or sliding and positively holds weights in any position at any time. Alten's adjustable counterbalance assures your operator the safest possible working conditions. Calibrations make it easy to locate weights for desired counterbalance. Interchangeable weights of various sizes are offered for all units making necessary only the purchase of such amount of counterbalance essential to each well condition.

The Alten pumping unit's bronze-bushed saddle bearing is really three sturdy bearings in one. Since only the bottom of the bearing wears, a 120-degree rotation gives you an entirely new bearing surface. You get 200% longer bearing life. And the bronze bearing withstands shock loads best.

- The rugged simplicity of the Alten saddle provides trouble-free operation with an absolute minimum of parts. It is "oversize" to stand up under the heaviest use and worst abuse.
- The Alten saddle also permits easy adjustment of the walking beam to and from the well for centering the polished rod hanger. And it allows convenient lateral adjustment of the walking beam.

MOST PRACTICAL HORSEHEAD

The horsehead of an Alten unit makes servicing your well faster and easier. Remove one bolt and the horsehead swings back over the beam. Or remove the horsehead completely. • Perfect alignment with the well is made possible by means of a radiused support between horsehead and beam. Simple adjusting screws make and maintain alignment. • Full side plates designed for maximum safety of your operator.

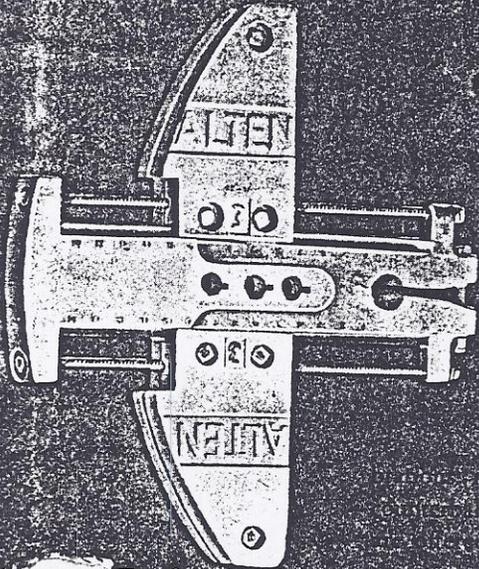

GENERAL INFORMATION

When you select Alton Equipment you put almost 65 years of experience to work for you. Since 1889 we have been building dependable equipment for the most exacting requirements of the Petroleum Industry. These many decades have earned us the widespread reputation and fame in whose products you can have complete confidence. Alton's pumping unit line has been expanded and completely redesigned. Alton now makes units of every popular size and makes them better.

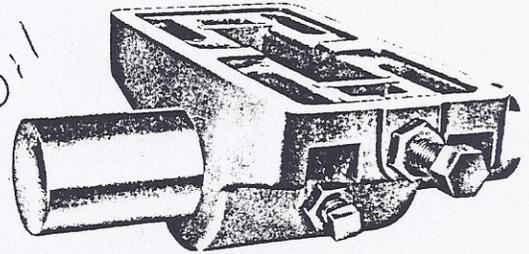

If you are now buying pumping units — or contemplate their purchase in the future — compare Alton first. You'll find a carefully built machine in which every part has been ingeniously engineered for long life and quick, easy servicing. No other unit has such a combination of outstanding features. Before it leaves the factory, every Alton unit is pre-tested to assure immediate, uninterrupted field operation. Alton units will positively perform to full rated capacity; each will spend more time operating and less time idled for repairs, maintenance and service.

ADJUSTABLE COUNTERBALANCE

New type adjustable counterbalance incorporates numerous features not found in any other type. Although rugged enough to operate under the most strenuous conditions it is so ingeniously simple that counterbalance weights may be adjusted in a matter of minutes by one man standing on the ground. Screw arrangement gives operator full control at all times; locking device prevents the weights from falling or sliding and positively holds weights in any position at any time. Callipers make it easy to locate weights for desired counterbalance. Interchangeable weights of various sizes are available on all units making necessary only the purchase of one amount of counterbalance essential to any condition.

Out of Business Oil

BRONZED BUSHED SADDLE BEARING

Here is a marked improvement over conventional types. Especially designed with very low bearing pressures, and corrugated grooved, it will give exceptionally long life. Design is such that it may be rotated several times to a new bearing surface. Provision is also made to adjust the walking beam to and from the well so that the polished rod hanger is always properly centered. And finally, the Alton saddle allows lateral adjustment of the walking beam.

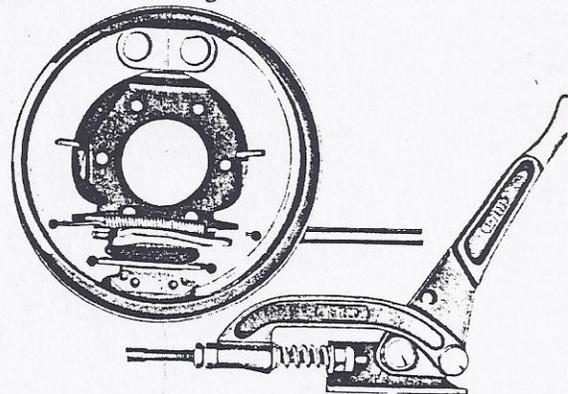

Bremont Oil 614-569 4/11

WREST PINS

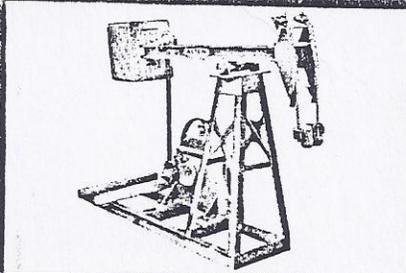

Large roller wrist pin bearings with which units are equipped have more than ample capacity and are fitted in accordance with those engineering standards that have been proved to give longest life. The tapered hole in the crank. On large units the crank is shown the wrist pin body will rotate if not held in place. We eliminated all such possibility by pressing a pin into a recess in the front side of the crank. Advantages of standard keys and keyways are eliminated.

SERVICE BRAKE

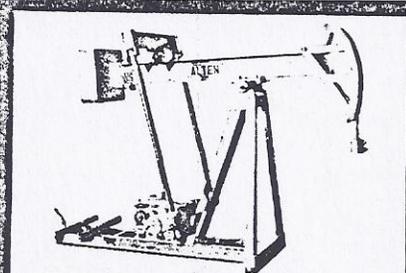

Here is the most efficient and convenient brake ever designed for a pumping unit. It is an automotive type that has ample capacity to hold the crank in any position. Rubber gaskets shut out snow or ice and protects against rust.

GEAR REDUCERS

Alten offers both helical and herringbone gears who need to apply the proper gear train for every application every time.

For some wells — particularly in shallow and medium depths where the face width of the gears are relatively narrow and the thrust loads are light — all of the inherent advantages of helical gears are utilized. It is an accepted fact that the hobbing process and crown shaving of helical gears results in extreme accuracy with the stress well distributed for maximum life. Tapered roller bearings are employed on all shafts. Gears and bearings operate in an oil bath which provides positive lubrication at all speeds and temperatures. On wells of greater depth and the corresponding

greater loads the advantages of herringbone gears become important. Some of the advantages are (1) no thrusts producing unnecessary deflection, (2) strong teeth for long life construction, (3) very low torque. Tapered roller bearings are used on the shafts. The gears operate in an oil bath which provides positive lubrication to all bearings. The gears operate in an oil bath which provides positive lubrication to all bearings. The gears operate in an oil bath which provides positive lubrication to all bearings. All Alten reducers have a filter in the oil bath of the housing — thus assuring

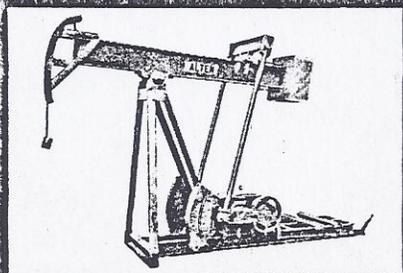

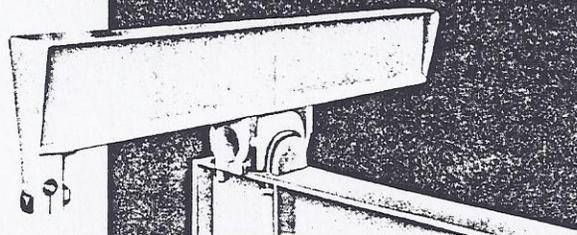

SAMSON POST

Four-legged samson post rigidly braced to carry maximum loads in addition to loads induced by minor installation errors. Front legs are wide spread for stability — rear legs closely spaced to allow the reducer to be turned end for end at the factory and electric motor drive mounted under the samson post — thus cost of base extension and its foundation is eliminated.

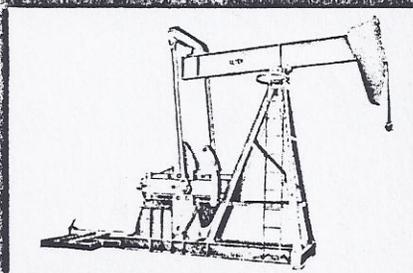

FRAME Rugged and heavy, Alten Frames give the unit complete support and transmit loads to the foundation with minimum stress. Proper bracing and anchor bolts are located at all points of stress. On the floor clearing models, the reducer sub-bases are welded to the frame. Most efficient pumping unit geometry is assured by the position of gear reducer.

EQUALIZER

An "over the beam" type equalizer is a feature of Alten units, thus the problems of bolts in tension — on large all crank balanced units — are eliminated. The equalizer itself is a rolled wide flanged beam which is superior to castings in which there is always a possibility of hidden defects. Equalizer bearings are bronze-bushed for maximum life; convex bottom of the bearing housing allows the equalizer to line up with the walking beam and pitmans.

	3-3/4	325	289	6.205	14.50	3.570	.425	
8-1/2	1-1/16	1250	18	1.610	1.02	1.370	.026	
	1-1/4	1125	24	1.765	1.36	1.445	.035	
	1-1/2	1000	36	2.005	1.87	1.565	.053	
	1-3/4	875	43	2.290	2.51	1.700	.072	
	2	775	63	2.620	3.23	1.860	.093	
	2-1/4	675	80	2.990	4.04	2.040	.117	
	2-1/2	600	99	3.405	4.93	2.245	.146	
	2-3/4	525	120	3.870	5.97	2.465	.176	
	3-3/4	325	223	6.145	10.94	3.570	.328	

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.

EXAMPLE

700 ft. well using 5/8" rods, 1-3/4" Pump to be pumped on 14" stroke.

PRL - 2.335 x 700 = 1634.5 Polished Rod Load
 PT - 4.45 x 700 = 3115 In. Lbs. Peak Torque
 CB - 1.700 x 700 = 1190 Lbs. Effective Counterbalance.

PRL - Polished Rod Load, lbs. per ft. of depth.
 PT - Peak Torque, inch lbs. per ft. of depth.
 CB - Effective Counterbalance, lbs. per ft. of depth.

To determine production or horsepower requirements for speeds other than 20 SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.

EXAMPLE

Unit to be operated at 15 SPM instead of 20 SPM

Production at 20 SPM - 80 Barrels per day
 Production at 15 SPM = $80 \div 20 \times 15 = 60$ Barrels per day.

Horsepower at 20 SPM - 2
 Horsepower at 15 SPM = $2 \div 20 \times 15 = 1.5$ HP

All calculations are based on 20 SPM and Specific Gravity of 1.0.

Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel have been neglected.

	2-1/4	1300	1125	170	3.095	9.50	2.040	3.585	9.77	2.500	.250
	2-1/2	1150	1000	210	3.525	11.52	2.245	4.015	11.79	2.705	.309
	2-3/4	1000	900	254	4.000	13.82	2.465	4.490	14.09	2.925	.373
	3-3/4	625	600	472	6.355	25.07	3.570	6.845	25.34	4.030	.694

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.

EXAMPLE

1500 ft. well using 5/8" rods, 1-3/4" Pump to be pumped on 23" stroke.

PRL - 2.410 x 1500 = 3615 Polished Rod Load
 PT - 8.17 x 1500 = 12,255 In. Lbs. Peak Torque
 CB - 1.700 x 1500 = 2550 Lbs. Effective Counterbalance.

PRL - Polished Rod Load, lbs. per ft. of depth.
 PT - Peak Torque, inch lbs. per ft. of depth.
 CB - Effective Counterbalance, lbs. per ft. of depth.

Depths are based on Pumping Unit capacity and sucker rod stress has been disregarded.

To determine production or horsepower requirements for speeds other than 20 SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.

EXAMPLE

Unit to be operated at 15 SPM instead of 20 SPM

Production at 20 SPM - 131 Barrels per day
 Production at 15 SPM = $131 \div 20 \times 15 = 98$ Barrels per day.

Horsepower at 20 SPM - 3
 Horsepower at 15 SPM = $3 \div 20 \times 15 = 2.25$ HP

All calculations are based on 20 SPM and Specific Gravity of 1.0.

Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel have been neglected.

Counterbalance Table

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.
 EXAMPLE--2000 ft. well using 5/8" Rods, 1-3/4" Pump to be pumped on 28" stroke.
 PRL - 2,450 x 2000 = 4900 Polished Rod Load
 PT - 10.50 x 2000 = 21,000 In. Lbs. Peak Torque
 CB - 1,700 x 2000 = 3400 Lbs. Effective Counterbalance.

To determine production or horsepower requirements for speeds other than 20 SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.
 EXAMPLE--Unit to be operated at 15 SPM instead of 20 SPM.
 Production at 20 SPM = 160 Barrels per day
 Production at 15 SPM = 160 ÷ 20 x 15 = 120 Barrels per day.
 Horsepower at 20 SPM = 4
 Horsepower at 15 SPM = 4 ÷ 20 x 15 = 3 HP

PRL - Polished Rod Load, lbs. per ft. of depth.
 PT - Peak Torque, inch lbs. per ft. of depth.
 CB - Effective Counterbalance, lbs. per ft. of depth.
 Depths are based on Pumping Unit capacity and sucker rod stress has been disregarded.
 All calculations are based on 20 SPM and Specific Gravity of 1.0.
 Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel have been neglected.

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.
 EXAMPLE--2500 ft. well using 3/4" Rods, 1-3/4" Pump to be pumped on 34" stroke.
 PRL - 3.020 x 2500 = 7550 Polished Rod Load
 PT - 14.62 x 2500 = 36,550 In. Lbs. Peak Torque
 CB - 2.160 x 2500 = 5400-Lbs. Effective Counterbalance.

To determine production or horsepower requirements for speeds other than 20 SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.
 EXAMPLE--Unit to be operated at 15 SPM instead of 20 SPM.
 Production at 20 SPM - 194 Barrels per day
 Production at 15 SPM = 194 - 20 x 15 = 145.5 Barrels per day.
 Horsepower at 20 SPM - 7
 Horsepower at 15 SPM = 7 - 20 x 15 = 5.25

PRL - Polished Rod Load, lbs. per ft. of depth.
 PT - Peak Torque, inch lbs. per ft. of depth.
 CB - Effective Counterbalance, lbs. per ft. of depth.
 Depths are based on Pumping Unit capacity and sucker rod stress has been disregarded.
 All calculations are based on 20 SPM and Specific Gravity of 1.0.
 Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel have been neglected.

STRUCTURE

Unit Structure Rating, A.P.I.	10,450 lbs.
Range of Strokes	24", 33", 42"
Well Working Center	5'0"
Well Clearance with Horsehead Tipped for Servicing	1'3"
Walking Beam Section and Weight	14" Wide Flange 43#
Height to Top of Walking Beam Above Top of Foundation	10'11 3/8"
Height of Saddle Bearing Above Top of Foundation	9'6"
Overall Length of Base	16'4"
Width of Base at Samson Post	3'11 3/4"
Section and Weight of Main Base Members	Wide Flange 8" - 17 lbs.
Section of Pitman	2 1/2" Std. Pipe
Wrist Pin Roller Bearings Self Aligning	30,000 Hrs. Min. Life
Saddle and Equalizer Bearings	Bronze Bushed
Saddle Bearing Projected Area	44 Sq. In.
Equalizer Bearing Projected Area	19 1/2 Sq. In.
Beam Counterweights	500 lbs. each
Weight of Twin Cranks	390 lbs. each
Weight of Master Crank Weights	285 lbs. each
Weight of Auxiliary Crank Weights	155 lbs. each
Polished Rod Hanger Cable	3/4" (6 x 37)
Foundation Bolts	1" x 20"
Distance from Bottom of Polished Rod Clamp to Top of Foundation at Bottom of Stroke	4'6 1/2"
Total Weight of Unit Less Beam Weights	6410 lbs.
Maximum Counterweight Effect at Maximum Polished Rod Stroke	8210 lbs.

GEAR REDUCER

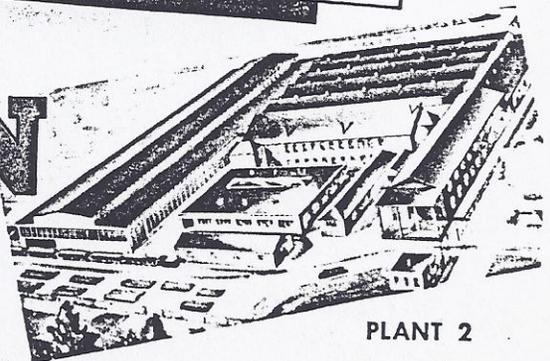

Peak Torque Rating, A.P.I.	57,000 in. lbs.
Nominal Horsepower Rating (at 20 S.P.M.)	11.5
Reduction Ratio (Double Reduction)	30.9:1
Weight of Complete Reducer (less Oil)	1580 lbs.
Bearings, Tapered Roller	30,000 Hrs. Min. Life
Sheave Section	3 Groove C
Sheave Pitch Diameter	19"
Oil Capacity	7 Gallons
Service Brake	Automotive Type

	2														
	2-1/4														
	3-3/4														

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.
 EXAMPLE--2600 ft. well using 3/4" Rods, 1-3/4" Pump to be pumped on 42" Stroke.
 PRL - 3100 x 2600 = 8060 Polished Rod Load
 PT - 19.74 x 2600 = 51,324 In. Lbs. Peak Torque
 CB - 2.160 x 2600 = 5616 Lbs. Effective Counterbalance.

To determine production or horsepower requirements for speeds other than 20 SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.
 EXAMPLE--Unit to be operated at 15 SPM instead of 20 SPM
 Production at 20 SPM - 240 Barrels per day
 Production at 15 SPM = 240 ÷ 20 x 15 = 180 Barrels per day.
 Horsepower at 20 SPM - 9.2
 Horsepower at 15 SPM = 9.2 ÷ 20 x 15 = 6.9 HP

PRL - Polished Rod Load, lbs. per ft. of depth.
 PT - Peak Torque, inch lbs. per ft. of depth.
 CB - Effective Counterbalance, lbs. per ft. of depth.
 Depths are based on Pumping Unit capacity and sucker rod stresses has been disregarded.
 All calculations are based on 20 SPM and Specific Gravity of 1.0.
 Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel have been neglected.

22	2-1/2	2925	2700	2575	256	3.575	14.63	2.245	3.885	14.91	2.530	63.0	4.070	15.02	2.705	.375
	2-3/4	2575	2375	2300	310	4.055	17.49	2.465	4.400	17.77	2.785	69.7	4.555	17.93	2.925	.456
	3-3/4	1625	1500	1500	577	6.445	31.63	3.570	6.445	31.63	3.570	69.7	6.940	32.01	4.030	.848

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.
 EXAMPLE--2600 ft. well using 3/4" Rods, 1-3/4" Pump to be pumped on 42" Stroke.
 PRL - 3.100 x 2600 = 8060 Polished Rod Load
 PT - 19.74 x 2600 = 51,324 In. Lbs. Peak Torque
 CB - 2.160 x 2600 = 5616 Lbs. Effective Counterbalance.

To determine production or horsepower requirements for speeds other than 20 SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.
 EXAMPLE--Unit to be operated at 15 SPM instead of 20 SPM.
 Production at 20 SPM - 240 Barrels per day
 Production at 15 SPM = 240 ÷ 20 x 15 = 180 Barrels per day.
 Horsepower at 20 SPM - 9.2
 Horsepower at 15 SPM = 9.2 ÷ 20 x 15 = 6.9 HP

PRL - Polished Rod Load, lbs. per ft. of depth.
 PT - Peak Torque, inch lbs. per ft. of depth.
 CB - Effective Counterbalance, lbs. per ft. of depth.
 Depths are based on Pumping Unit capacity and sucker rod stress has been disregarded.
 All calculations are based on 20 SPM and Specific Gravity of 1.0
 Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel. have been neglected.

2	4725	3925	160	2.450	10.50	1.700	2.665	10.78	1.895	42.3	2.960	11.20	2.160	.236		
2-1/4	4125	3500	209	2.805	13.23	1.860	3.050	13.58	2.080	48.2	3.310	13.86	2.320	.308		
3-3/4	1775	1625	735	6.580	42.14	3.570	6.580	42.14	4.030	1.850	7.330	62.70	4.030	1.850		

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.
 EXAMPLE--3000 ft. well using 3/4" Rods, 1-3/4" Pump to be pumped on 48" Stroke.
 PRL - 3.160 x 3000 = 9480 Polished Rod Load
 PT - 24.00 x 3000 = 72,000 In. Lbs. Peak Torque
 CB - 2.160 x 3000 = 6480 Lbs. Effective Counterbalance.

To determine production or horsepower requirements for speeds other than 20 SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.
 EXAMPLE--Unit to be operated at 15 SPM instead of 20 SPM.
 Production at 20 SPM - 274 Barrels per day
 Production at 15 SPM = 274 ÷ 20 x 15 = 205.5 Barrels per day.
 Horsepower at 20 SPM - 12
 Horsepower at 15 SPM = 12 ÷ 20 x 15 = 9 HP

PRL - Polished Rod Load, lbs. per ft. of depth.
 PT - Peak Torque, inch lbs. per ft. of depth.
 CB - Effective Counterbalance, lbs. per ft. of depth.
 Depths are based on Pumping Unit capacity and sucker rod stress has been disregarded.
 All calculations are based on 20 SPM and Specific Gravity of 1.0.
 Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel have been neglected.

ALTEN PUMPING UNIT

STRUCTURE

Unit Structure Rating, A.P.I.	16,000 lbs.
Range of Strokes	34", 44", 54"
Well Working Center	81"
Well Clearance with Horsehead Tipped for Servicing	17 3/4"
Walking Beam Section and Weight	21"
	Wide Flange 68 lbs.
	14' 7 3/4"
Height to Top of Walking Beam Above Top of Foundation	12' 6 1/2"
Height of Saddle Bearing Above Top of Foundation	18' 10 1/2"
Overall Length of Base	5' 9"
Width of Base at Samson Post	Wide Flange
Section and Weight of Main Base Members	12" - 27 lbs.
	3" Std. Pipe
	30,000 Hrs. Min. Life
	Bronze Bushed
Section of Pitman	60 Sq. In.
Wrist Pin Roller Bearings Self Aligning	28 Sq. In.
Saddle and Equalizer Bearings	1300 lbs. each
Saddle Bearing Projected Area	1060 lbs. each
Equalizer Bearing Projected Area	1" (6 x 37)
Weight of Twin Cranks	1 1/4" x 18"
Weight of #4 Crank Weights	6' 4"
Polished Rod Hanger Cable	14,350 lbs.
Foundation Bolts	9,260 lbs.
Distance from Bottom of Polished Rod Clamp to Top of Foundation at Bottom of Stroke	
Total Weight of Unit with #4 Weights	
Maximum Counterweight Effect at Maximum Polished Rod Stroke (with #4 weights)	

GEAR REDUCER

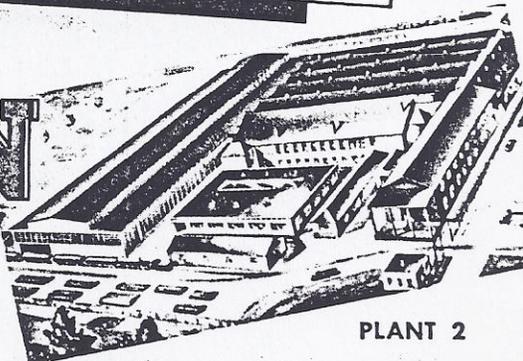

Peak Torque Rating, A.P.I.	114,000 in. lbs.
Nominal Horsepower Rating (at 20 S.P.M.)	23
Reduction Ratio (Double Reduction)	30.9:1
Weight of Complete Reducer (less Oil)	2400 lbs.
Bearings, Tapered Roller	30,000 Hrs. Min. Life
Sheave Section	4 Groove C
Sheave Pitch Diameter	20.10"
Oil Capacity	13 Gallons
Service Brake	Automotive Type

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.
 EXAMPLE--4000 ft. well using 3/4" rods, 1-3/4" Pump to be pumped on 54" stroke.

To determine production or horsepower requirements for speeds other than 20 SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.
 EXAMPLE--Unit to be operated at 15 SPM instead of 20 SPM.
 Production at 20 SPM - 308 Barrels per day
 Production at 15 SPM = 308 ÷ 20 x 15 = 231 Barrels per day.
 Horsepower at 20 SPM - 18

PRL - Polished Rod Load, lbs. per ft. of depth.
 PT - Peak Torque, inch lbs. per ft. of depth.
 CB - Effective Counterbalance, lbs. per ft. of depth.
 Depths are based on Pumping Unit capacity and sucker rod stresses are based on disregarded.
 All calculations are based on 20 SPM and Specific Gravity of 1.0.
 Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel have been neglected.

ALTEN PUMPING UNIT

STRUCTURE

Unit Structure Rating, A.P.I.	20,800 lbs.
Range of Strokes	34", 44", 54", 64"
Well Working Center	96"
Well Clearance with Horsehead Tipped for Servicing	23 3/4"
Walking Beam Section and Weight	24"
	Wide Flange 94 lbs.
	16'4"
Height to Top of Walking Beam Above Top of Foundation	13'11"
Height of Saddle Bearing Above Top of Foundation	21'10 3/4"
Overall Length of Base	5'10"
Width of Base at Samson Post	Wide Flange
Section and Weight of Main Base Members	27 lbs.
	3" Std. Pipe
Section of Pitman	30,000 Hrs. Min. Life
Wrist Pin Roller Bearings Self Aligning	Bronze Bushed
Saddle and Equalizer Bearings	96 Sq. In.
Saddle Bearing Projected Area	59 1/2 Sq. In.
Equalizer Bearing Projected Area	1770 lbs. each
Weight of Twin Cranks	1500 lbs. each
Weight of #5 Crank Weights	1" (6 x 37)
Polished Rod Hanger Cable	1 1/4" x 18"
Foundation Bolts	7'2 1/8"
Distance from Bottom of Polished Rod Clamp to Top of Foundation at Bottom of Stroke	20,620 lbs.
Total Weight of Unit with #5 Weights	12,530 lbs.
Maximum Counterweight Effect at Maximum Polished Rod Stroke (with #5 weights)	

GEAR REDUCER

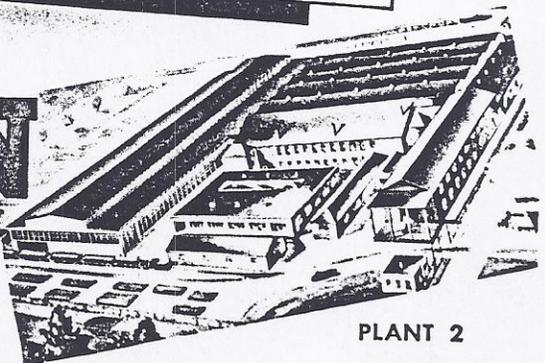

Peak Torque Rating, A.P.I.	160,000 in. lbs.
Nominal Horsepower Rating (at 20 S.P.M.)	32.3
Reduction Ratio (Double Reduction)	30.2:1
Bearings, Tapered Roller	30,000 Hrs. Min. Life
Sheave Section	5 Groove C
Sheave Pitch Diameter	24"
Oil Capacity	15 Gallons
Service Brake	Automotive Type

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.
 EXAMPLE - 2700 ft. well using 7/8" rods, 2-1/4" Pump to be pumped on 64" Stroke.

PRL - 4,850 x 2700 = 13,095 Polished Rod Load
 PT - 57.28 x 2700 = 154,656 In.-Lbs. Peak Torque
 CB - 3,060 x 2700 = 8262 Lbs. Effective Counterbalance.

To determine production or horsepower requirements for speeds other than 20SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.
 EXAMPLE--Unit to be operated at 15 SPM instead of 20 SPM.

Production at 20 SPM - 604 Barrels per day
 Production at 15 SPM = 604 ÷ 20 x 15 = 454 Barrels per day.
 Horsepower at 20 SPM = 24 ÷ 20 x 15 = 18 HP

PRL - Polished Rod Load, lbs. per ft. of depth.
 PT - Peak Torque, inch lbs. per ft. of depth.
 CB - Effective Counterbalance, lbs. per ft. of depth.
 Depths are based on Pumping Unit capacity and sucker rod stress has been disregarded.
 All calculations are based on 20 SPM and Specific Gravity of 1.0.
 Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel have been neglected.

To figure the Polished Rod Load, Peak Torque and Counterbalance required for a well, select the values shown for the length stroke, size pump and size rods to be used and multiply by the number of feet of depth.

EXAMPLE - 3000 ft. well using 7/8" rods, 2-1/4" Pump to be pumped on 74" Stroke.

PRL - 5,000 x 3000 = 15,000 Polished Rod Load
 PT - 71.78 x 3000 = 215,340 In.Lbs. Peak Torque
 CB - 3.060 x 3000 = 9180 Lbs. Effective Counterbalance.

To determine production or horsepower requirements for speedsother than 20 SPM, divide the values obtained from the tables by 20 and multiply by the number of strokes per minute required.

EXAMPLE-- Unit to be operated at 15 SPM instead of 20 SPM.
 Production at 20 SPM = 699 Barrels per day.
 Production at 15 SPM = 699 ÷ 20 x 15 = 524 Barrels per day.
 Horsepower at 20 SPM = 30.84
 Horsepower at 15 SPM = 2 ÷ 20 x 15 = 22.13 HP

Depths are based on Pumping Unit capacity and sucker rod stress has been disregarded.
 All calculations are based on 20 SPM and Specific Gravity of 1.0.
 Production values are based on 80% pump efficiency, rod and tubing stretch and overtravel have been neglected.

Counterbalance Tables

ENGINEERING DEPT.

TOLEDO, OHIO

TULSA, OKLA.

**SUCKER ROD LOADS
IMPULSE FACTORS
TAPERED ROD STRINGS
PUMP EFFICIENCIES (APPARENT VOLUMETRIC)**

MILLS SUCKER ROD LOAD FORMULA

$$P = W_r \left(1 + \frac{LN^2}{70500} \right) + W_{..}$$

- P = Polished rod load.
- W_{..} = Weight of fluid (based on net plunger areas) and 1.00 S. G.
- W_r = Weight of Rods.
- L = Polished rod Stroke — inches.
- N = Cycles per minute.

Values of W_{..} are found in Table 3. Multiply these values by specific gravity if known.

Values of W_r are found in Table 1.

Acceleration factors for Mills Formula are given in Table 2.

If pumping fluid level is known, use this value in calculating weight of fluid.

Otherwise multiply values in table 3 by depth to pump.

**USING THE DATA HEREIN, SUCKER ROD LOADS
CAN BE EASILY AND QUICKLY CALCULATED**

TABLES FOR CALCULATING SUCKER ROD LOADS

TO FIND POLISHED ROD LOAD—

Multiply Wt. of Rods per foot by length of Rod String × Acceleration Factor, and add Wt. per ft. of Fluid × Depth to Pump × Specific Gravity of Fluid.

WEIGHT OF RODS PER FOOT

Alten designed for long life and maximum service. All welded steel construction provides greater strength and rigidity. Grooved bronze bearings carry lubrication along the entire length. Oil seals make all bearings dust proof and leak proof. Set screws at saddle bearings permit sure adjustment of horsehead. Alten underpull jacks are constructed to allow a wide range of strokes.

INSTALLATION AND MAINTENANCE INSTRUCTIONS

for ALTEN Pumping Units

ALTEN Pumping Units are designed to give long trouble-free service, if operated within rated capacity and properly installed and serviced. Correct counterbalancing and maintenance are two important requirements for maximum pumping unit, prime mover, and belt life.

BEFORE PLACING UNIT IN OPERATION THE FOLLOWING PRECAUTIONS SHOULD BE TAKEN:

- (1) Make certain unit is level, etc. (See section on Installation of Unit).
- (2) Fill Gear Reducer with oil to oil level indicated on gauge. (See section on Lubrication of Gear Reducer for type oil).
- (3) Lubricate all Bearings. (See section on Lubrication of Bearings).
- (4) Tighten all Bolts. This should include Foundation Bolts and Wrist Pin Nuts.
- (5) Adjust Brake.
- (6) Check clearance of Cranks and Weights with Foundation and V-Belt Guard.
- (7) Adjust V-Belts to proper tightness. (See section on Engine and V-Belt Adjustment).
- (8) Adjust Counterbalance weights to estimated counterbalance.

AFTER 24 HOURS OPERATION THE FOLLOWING SHOULD BE CHECKED:

- (1) Tightness of all bolts.
- (2) Tightness of wrist pin nuts.
- (3) Reducer oil level.
- (4) Adjust counterbalance if required.

FOUNDATION

A concrete foundation is recommended because of its rigidity and permanency. Good results are often obtained, however, on semi-permanent locations, with heavy wooden timbers properly spaced and supported. An anchor bolt layout drawing is furnished with each unit for installation purposes. The actual depth and width of the foundation is dependent upon the soil conditions existing at the location. It is a must that the concrete foundation extend below the frost line to give satisfactory service.

To make the installation of the unit over the foundation bolts easier, it is well to place a piece of pipe around the foundation bolt, so as to be flush with the top of the foundation. This will allow the bolt to be adjusted, to compensate for slight errors in layout.

INSTALLATION OF UNIT

To assist in grouting and leveling, the unit should be set on wooden blocks (approximately 1" high) located close to the foundation bolts. After unit is assembled the frame should be leveled at both ends of the gear reducer and at the front beam, which supports the samson post front legs. The unit should then be lined up with the well. The horsehead is easily aligned with the well by using a plumb bob hanging from the top of the horsehead. Be sure to allow for half the wire line diameter.

When the unit is properly aligned with the well the frame should again be checked to make sure it is level and the pitmans should be checked with a level to make certain they are vertical. For long trouble-free service, it is most important that the unit be properly aligned with the well and is level on the foundation. The four-way adjustment on the saddle bearing assembly and the adjustable horsehead serve to make this job easier.

When tightening the U-Bolts, used in attaching various assemblies, both ends of the U-Bolt should be drawn tight at the same time. (Do not tighten one side fully tight before tightening the other.)

After the unit has been thoroughly checked and is properly installed, the frame should be grouted in. It is well to bear in mind that after the unit is grouted in, it cannot be moved on the foundation without considerable expense.

WIRE LINE ALIGNMENT

Care should be taken to make certain the polished rod hanger is properly centered on the wire line. Normally the polished rod hanger will center itself but occasionally it is necessary to center it at the time of installation to make certain both wire lines are subject to equal loads.
