

THE MAXIMIZER

The most versatile pumping unit in the industry

The MAXIMIZER fits more well conditions and performs better under changing conditions than any other pumping unit. Its exclusive design provides performance and dependability unmatched throughout the rest of the industry.

One of the unique design features

**High quality wire
welding insures
structural integrity.**

that results in greater efficiency and the most economical operation is the configuration of the crank rotation. Conventional geometry used on most other units is restricted to evenly divided crank rotation — 180° on the upstroke and 180° on the down-stroke. The MAXIMIZER's design permits a full 186° of its clockwise crank rotation to the upstroke where most of the work is done. This crank rotation configuration represents the most desirable balance between the versatility of conventional geometry and the focused application of special geometry.

In addition, the pumping unit can be run in either direction and used with either steel or fiberglass rods. Its built-in versatility allows it to pump productively under changing well site conditions and wherever it may be moved.

Dependability

Performance, in both domestic and international fields has consistently demonstrated the value of the MAXIMIZER's improved unique geometry. It demonstrates, too, the importance of the engineering and quality built into all the MAXIMIZER's components. Each component is the product of superior design, quality materials, and experienced manufacturing.

The MAXIMIZER continually saves energy and money in all kinds of oil field conditions. It is assurance that the pumping unit that works effectively and efficiently under optimum conditions will work just as effectively when fluid levels drop or when moved to another site.

**Reliability, performance,
versatility, economics,
all reasons to choose
the MAXIMIZER.**

THE MAXIMIZER II

The new standard of Efficiency and Productivity

**State of the art
computer aided design
stations and specialized
computer analysis are
used to qualify design.**

The MAXIMIZER II is designed and manufactured to meet operator's needs for greater performance and higher efficiency in a readily available pumping unit. The MAXIMIZER II shares with the MAXIMIZER advantages and benefits not found in other manufacturers' pumping units.

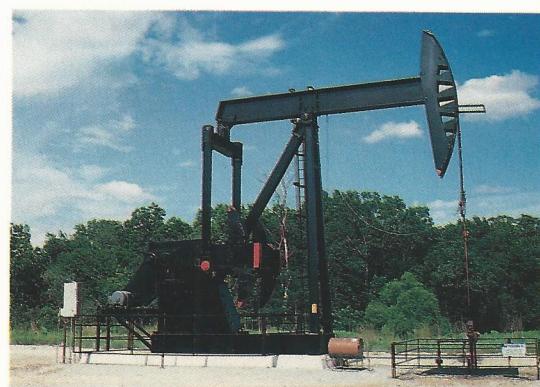

The exclusive crank rotation design allows more rotation to the upstroke. This, combined with the most effective counter balance phasing, creates lower net torque than any other pumping unit under most well conditions. The enhanced geometry delivers more lifting with less horse power.

For the operator anxious to closely manage all the variables involved in maximizing production profitability, the savings can be substantial.

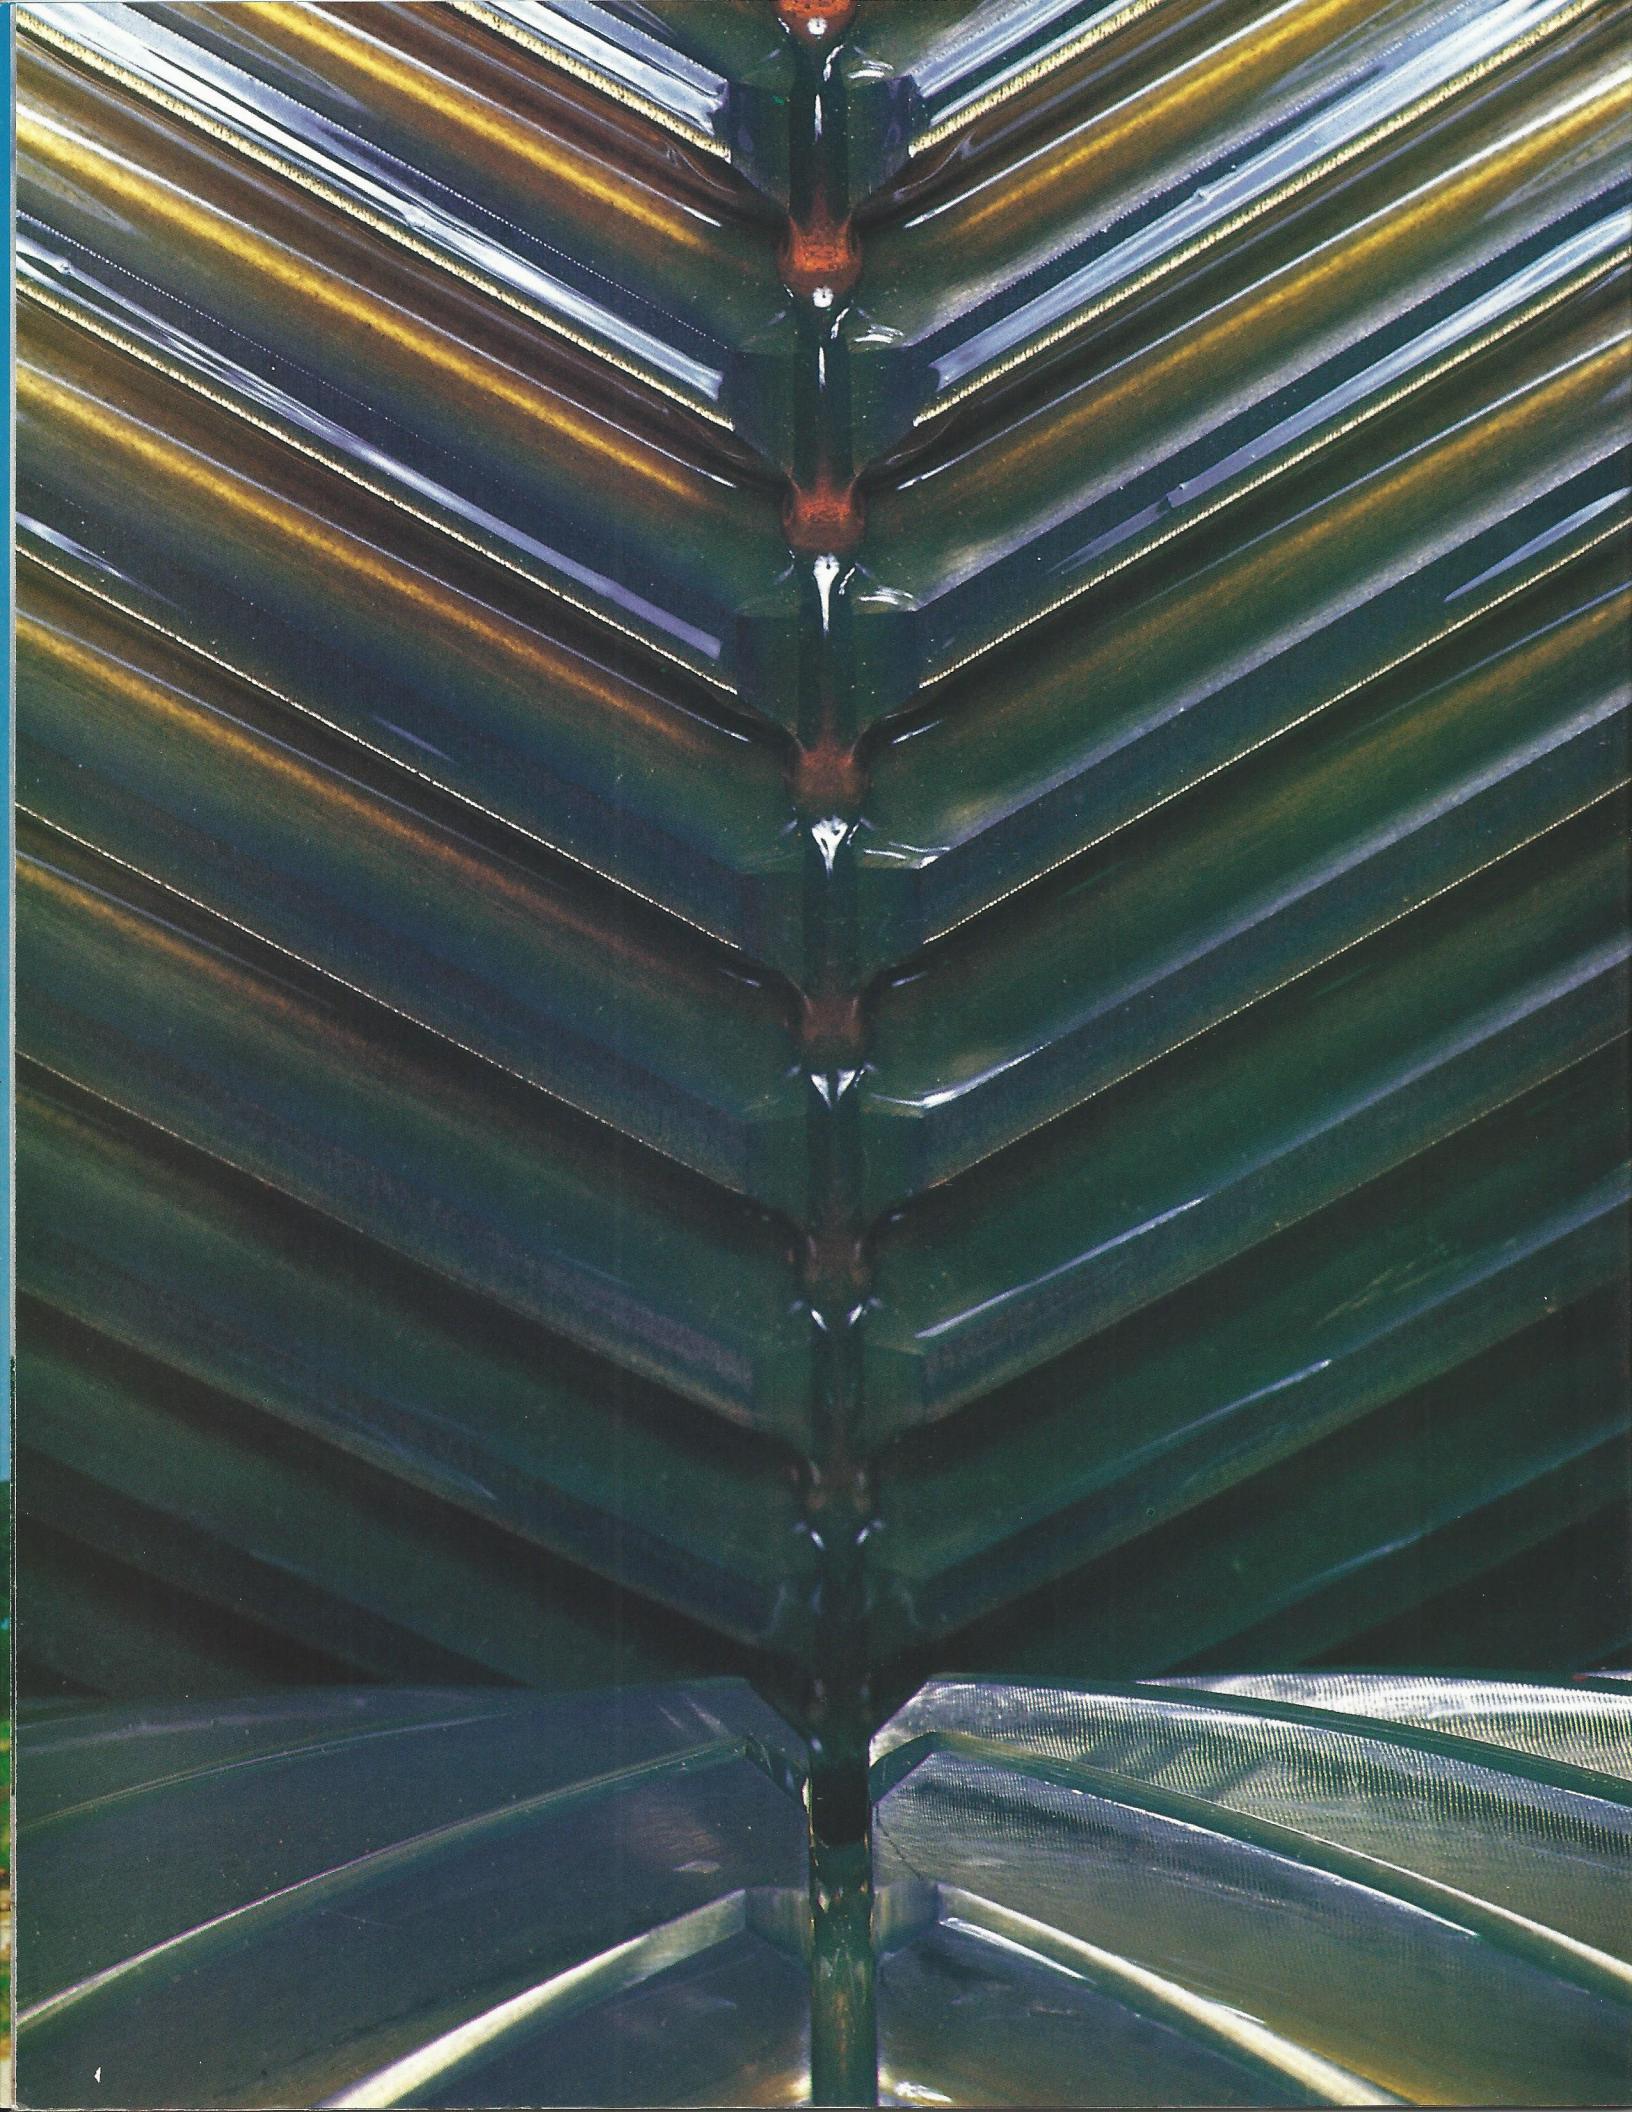

Tangible, measurable benefits of the MAXIMIZER II over the normal pushup special geometry units include:

- 25 percent larger useful load range when both are loaded with the counterbalance required to achieve maximum structure loading
- substantially lower polished rod acceleration during the critical first 40% of the upstroke
- lower power costs due to more uniform loading of the prime mover
- improved permissible load characteristics

**The MAXIMIZER II—
enhanced geometry,
heavier loads, reduced
net torque.**

The engineering and manufacturing experience that produces the MAXIMIZER II results in a versatile, energy effective pumping unit that maximizes production and minimizes cost.

AMERICAN MADE

Quality Components

**Quality verification is
an integral part of our
manufacturing
process.**

Every component of an American International pumping unit is designed and manufactured for high productivity, low cost maintenance and long oil field life. All units feature a rugged gearbox that stands up to the demands of continuous operation — far better than any other gearbox in the field. Quality controlled manufacture of all components accounts for the dependability and efficiency that has made these pumping units the standard of the industry. Unlike other manufacturers, the American International's gearbox uses a one piece gearcase which minimizes gear lubricant leakage and related environmental concern. With American International's innovative bolted crank arm attachment, the gearbox can be easily and quickly changed in the field which nearly eliminates costly down time.

Inside the American International gearbox is a precisely engineered gear train featuring tough, rugged herringbone gears. Herringbone gears designed and

manufactured by American International are the standard of excellence for pumping unit gear reducers. Strong alloy steel pinions and ductile iron gears further attest to American International's commitment to quality. Machined to precise tolerances and assembled in our plant, the result is an optimum fit and a highly efficient system. The gear reducer contains oversized anti-friction bearings (not energy consuming bronze bushings). Each bearing is set in a carrier for ease of removal and installation. The American International gearbox is so smooth and energy efficient that even the largest size can be easily turned by hand.

Bearing lubrication is of utmost importance. An exclusive feature of an American International unit is its gearbox lubrication system. This unique system utilizes oil buckets to fill troughs that continuously feed oil to the gearbox bearings. An adequate supply of oil is supplied to each bearing regardless of the direction of rotation and even at pumping speeds of less than one stroke per minute.

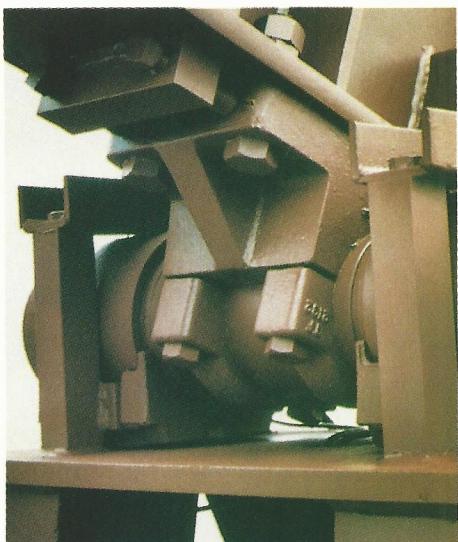

No other pumping unit performs so well under so many different oil field conditions.

**Positive, dependable
lubrication with each
revolution.**

AMERICAN MADE

High Reliability Assures Consistent Performance

**Saddle bearing has
tapered roller bearings.**

The MAXIMIZER II is controlled by American International for American International customers. It is your assurance that the performance of your pumping unit will reflect American International's tradition of reliability.

Highest quality bearings

The anti-friction bearings in American International's pumping units boost drive efficiency, need little maintenance and offer longtime, durable performance. All units have oversized roller bearings, not bronze bushings.

**The reliable and
performance tested
Bendix brake.**

operations stops. The positive stop pawl can be engaged with notches in the brake drum to provide added safety.

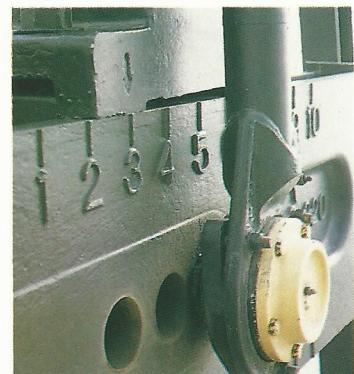

American International maintains a full inventory of spare parts for all models.

The Springplate Equalizer

All of the MAXIMIZER units have the perfect equalizer pitman connection, with no bearings to wear out and no lubrication requirements to remember. The Springplate Equalizer's vibration-free operation equalizes pitman loads and maintains rigidity. It is a contributing factor in American International's impressive record of dependability.

The manufacturing of every component in the MAXIMIZER and

**Wrist pins have heavy
duty self aligning spheri-
cal roller bearings.**

**The Springplate upper
pitman connection has no
moving parts to replace.**

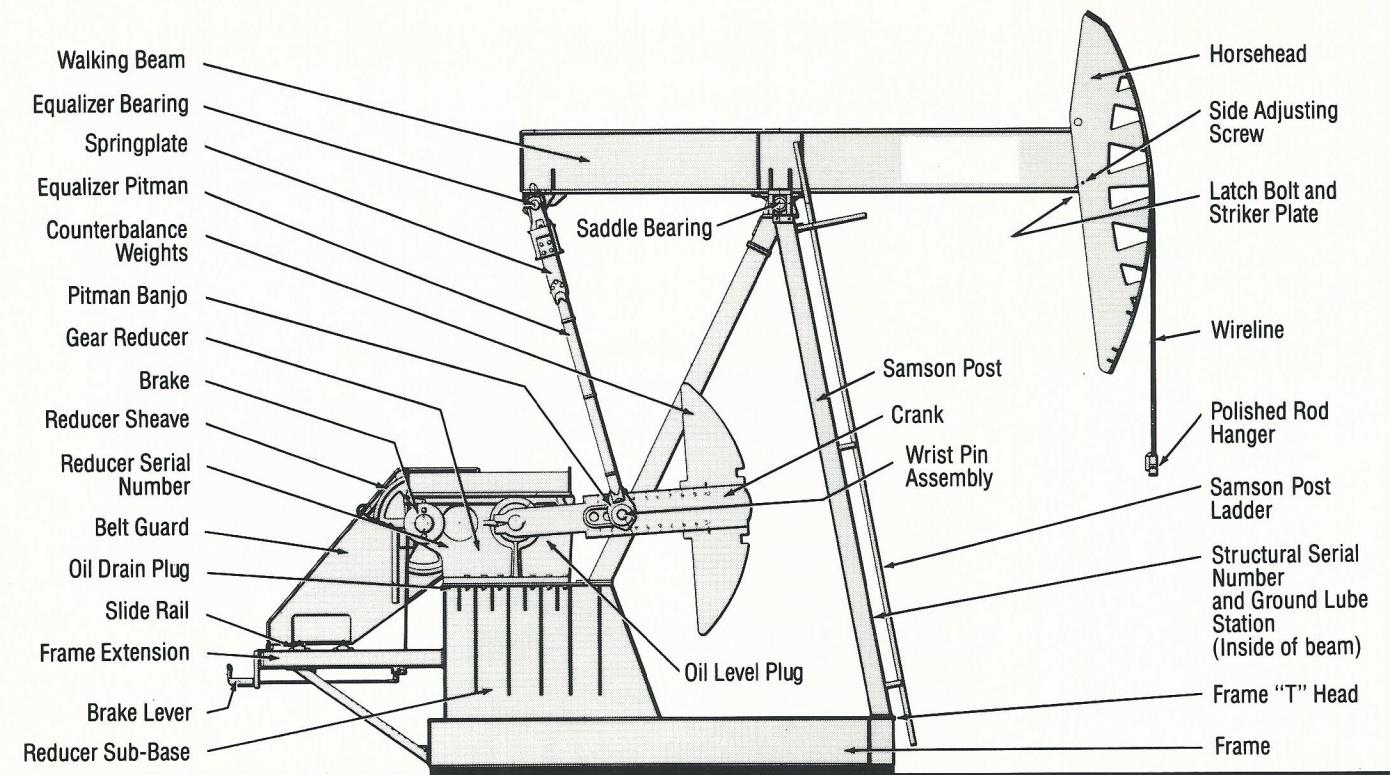

Wrist pin bearings are self-aligning spherical roller bearings with a one-piece outer race that eliminates field adjustment. All units use tapered roller bearings at the saddle and equalizer bearings.

Each gearbox is equipped with a high capacity industrial brake for

Dallas, Texas

Pumping Unit Specifications Technical Data

Lubrication instructions

The MAXIMIZER is an extremely rugged, durable pumping unit that will perform reliably for a long time. As always, proper care and lubrication assure that your unit will operate with maximum efficiency for many, trouble-free years.

Bearing assemblies and the pumping unit reducer are components that particularly should receive proper maintenance.

Herringbone gear reducer

For temperatures down to 0°F, use an AGMA 5EP (ISO VG 220) premium, mild, extreme-pressure lubricant with rust and oxidation inhibitors and an anti-foam agent.

Pour point of the oil should be 5°F or lower.

For temperatures down to -30°F, use AGMA 4EP (ISO VG 150) premium, mild, extreme pressure lubricant with rust and oxidation inhibitors and an anti-foam agent.

Pour point of the oil should be -15°F or less. For low temperature operation, the oil should have sufficient fluidity to permit a free flow of oil into the bearings. Check for water in reducer every six months.

To obtain long life from a pumping unit reducer, it is necessary at all times that the oil is of suitable viscosity and free from foreign material, sludge and water.

Structural bearings

The wrist pin, equalizer and saddle bearings should be lubricated with AAR M-942 bearing grease. Each bearing assembly is fitted with a hydraulic grease fitting so that the lubricant can be applied with a gun. They should be greased at six-month intervals.

In some conditions, more frequent lubricating is required, depending on temperature and the condition of oil seals.

Pumping Speed Calculation Formulas

Strokes per minute

example:

$$SPM = \frac{RPM}{R} \times \frac{d}{D}$$

$$SPM = \frac{1160}{30.32} \times \frac{12}{44} = 10.4$$

Prime Mover Sheave Diameter

example:

$$d = \frac{SPM \times R \times D}{RPM}$$

$$d = \frac{10 \times 30.32 \times 44}{1160} = 11.5$$

Use nearest size available and SPM formula for estimate of pumping speed.

Terms: RPM = revolutions per minute of prime mover (electric motor)

R = ratio of reducer gears (see page 1, D320G)

d = pitch diameter of prime mover sheave

D = pitch diameter of reducer sheave (see page 1)

Instructions for ordering spare parts

American views service as one of our primary company goals, and the delivery of spare parts is given a very high priority. Our records are maintained by the UNIT SERIAL NUMBER which is located on the samson post and REDUCER SERIAL NUMBER which is located on the gear reducer.

When ordering parts, it is essential that we have these numbers in addition to a general description of the part. The best insurance against unit downtime and parts compatibility is quality American replacement parts.

WARNING: THE USE OF PARTS WHICH DO NOT MEET THE AMERICAN QUALITY AND DESIGN SPECIFICATIONS COULD RESULT IN UNIT FAILURE AND/OR SERIOUS INJURY TO PERSONNEL NEAR THE PUMPING UNIT. BEFORE PERFORMING MAINTENANCE OR INSPECTION ON A PUMPING UNIT, MAKE CERTAIN THAT PRIME MOVER IS OFF AND LOCKED-OUT IN ADDITION TO PREVENTING ROTATION OF CRANKS AND COUNTERWEIGHTS BY CHAINING OR BLOCKING TO PREVENT ROTATION. DO NOT USE BRAKE AS A SAFETY STOP, IT IS INTENDED ONLY FOR OPERATIONAL STOPS. ANY MOVEMENT OF THE UNIT DURING MAINTENANCE OR INSPECTION OF THE UNIT CAN CAUSE SERIOUS PERSONAL INJURY.
